

# Cold Recycled Mix

*100% Recycled Asphalt Pavement (RAP) is used in the construction of municipal roads, lowering both the impact on the environment and the cost of materials.*

**A blend of asphalt emulsion and 100% Recycled Asphalt Pavement that creates a structurally sound base.**

## FEATURES & BENEFITS

- Lowers impact on the environment
- Lowers cost of materials
- Adds structural strength to an existing road
- Self-healing, flexible, and mitigates cracking

# Cold Recycled Mix

Asphalt removal

Process and stockpile

Haul and place

100% Cold Recycled Mix surface

Reuse of aggregates and viable asphalt cement reduces energy consumption and greenhouse gas emissions.

The recycled asphalt pavement used in the Cold Recycled Mix (CRM) process can be drawn from various sources. Milling from large projects or excavations from small jobs can be processed for Cold Recycled Mixes.

CRM is placed, using a specialized mixing paver that blends the processed RAP with asphalt emulsion. This paver is equipped with computerized slope and grade controls and extrudes the mix through a conventional screed that initiates the compaction process. A complement of rollers finalizes compaction and the new base is ready for a wearing surface.

The process is an excellent and inexpensive way to add structural strength to an existing road and has been used to successfully convert low volume gravel roads into pavements that can support higher traffic counts.

Walker Construction Limited offers more than just the placement of CRM. Our services include: sourcing recycled material, crushing and stockpiling, engineered mix designs and the application of a waterproof wearing surface.
